

OVERVIEW

Aben Resources is a Canadian uranium, gold and silver exploration company developing properties in Saskatchewan's Athabasca Basin and the Yukon, NWT.

Aben holds an interest in approx. 40,000 acres of highly prospective uranium ground within the eastern flank of the Athabasca Basin in northern Saskatchewan. The Company owns a 40% interest and Skyharbour Resources (TSX-V: SYH) owns the other 60% in the Mann Lake property located approx. 25km SSW of the McArthur River Uranium Mine and 15km NE of Cameco's Millennium discovery. The property is adjacent to Cameco's Mann Lake Joint Venture where an aggressive 13,000 metre, 18-hole diamond drill program is currently underway. Aben also owns 49% of the Huard-Kirsch Lakes Uranium Project with Denison Mines (TSX: DML) owning the other 51%.

The Company also owns a 100% interest in the 18,314 acre Justin Gold Project located in SE Yukon. A phase one 2,020 metre diamond drill program consisting of ten drill holes was carried out in 2011 to test never before drilled gold zones. Aben made a significant new greenfields gold discovery at the project when it intercepted 60m of 1.19 g/t Au in hole JN11009 at the POW Zone.

Aben completed an aggressive exploration and drill program in 2012 with notable results of 46.4m of 1.49 g/t Au in drill hole JN12011. The mineralization at the POW Zone displays geochemical affinity to an Intrusion Related Gold System (IRGS) and indicates that the mineralizing system was long-lived. Mineralization, which remains open in all directions, has been traced along surface for approximately 450m west-east by 200m north-south and to 205m depth.

The Company has systematically explored and acquired a large land package directly east of the Yukon/NWT Territorial border known as the Selwyn Recce area. Field crews completed a regional reconnaissance program on Aben's Selwyn Recce Precious and Base Metals Project that included regional prospecting as well as geochemical and geophysical surveys. 147,404 acres of highly prospective ground in the area was staked by the Company.

Aben Resources Ltd.'s goal is to increase shareholder value by developing exploration projects near world-class deposits that have the potential of becoming new discoveries.

Mann Lake and Huard-Kirsch Lakes Uranium Projects, Athabasca Basin

- Aben owns a 40% interest and Skyharbour Resources Ltd. (TSX-V: SYH) owns the other 60% of the Mann Lake property, which is located approximately 25 kilometres to the SSW of the McArthur River Mine and 15 kilometres to the NE of Cameco's Millennium (U3O8) discovery, and occurs at the northern extent of the B1 conductor.
- The property is adjacent to the Mann Lake Joint Venture operated by Cameco (52.5%) with partners International Enexco (30%) and AREVA (17.5%), in which a 13,000m, 18-hole diamond drill program is underway.
- International Enexco announced on March 10, 2014 that a drill discovery had been made by operator Cameco consisting of 2.31% eU3O8 over 5.1m including 10.92% eU3O8 over 0.4m.
- Aben's Mann Lake Uranium Project has seen over \$3 million of previous exploration including recent geophysics and two diamond drill programs totaling 5,400m carried out in 2006 and 2008.
- One drill hole contained anomalous uranium up to 73.6 ppm over a 1.5m interval where background uranium values are commonly between 1 and 5 ppm.
- The Mann Lake Uranium Project boasts highly prospective geology and geochemistry, and a robust discovery potential with additional work recommended on several untested targets.

Justin Gold Project, Yukon Territory – 100% Ownership

- Aben owns a 100% interest in the 18,314 acre Justin Gold Project located in the southeast Yukon on the prolific Tintina Gold Belt approx. 35 km southeast of the Cantung Mine. The property is accessed by an all-season road.
- A phase one 2,020 metre diamond drill program consisting of ten drill holes was carried out in 2011 on the project and was the first ever completed on the POW, Confluence and Kangas zones.
- In November 2011, the Company released the first drill hole results from the program in which a significant new green-fields gold discovery was made at the POW Zone. Aben intercepted 60 metres of 1.19 g/t gold in hole JN11009 at a vertical depth of 113 metres. The second hole drilled into the POW Zone confirmed the initial gold discovery with another significant intercept.
- Aben also made a new high grade silver-copper discovery at the Kangas Zone 1.4km south of the POW Zone. A near surface zone returned 7320 g/t Ag (234 oz/ton) and 3.52% Cu over 1.07m.
- A total of 1,994 metres was drilled in nine holes during the 2012 field season with all seven drill holes that were completed to their target depths successfully intersecting gold.
- Significant drill results include from the program included 46.4 metres of 1.49 g/t gold in hole JN12011 and 88.5 metres of 0.73 g/t gold in hole JN12018. Mineralization, which remains open in all directions, has been traced along surface for approximately 450 metres west-east by 200 metres north-south and to 205 metres depth.
- Multi-phase precious metal mineralization is present in the POW Zone including massive skarn replacement style mineralization and structurally controlled stockwork vein hosted mineralization. Both phases of mineralization display geochemical affinity to an Intrusion Related Gold Model and indicate that the mineralizing system was long-lived.

Selwyn Recce Project, Northwest Territories – 100% Ownership

- Aben has been granted the exploration rights to 426,821 acres of land directly east of the Yukon/NWT Territorial border. The Company has also staked an additional 147,404 acres of highly prospective ground in the NWT and Yukon east of ATAC Resources (TSX.V: ATC).
- Field crews completed a very large scale regional reconnaissance program on Aben's Selwyn Recce Project in 2011 that included geological mapping, regional prospecting, geochemical surveys and geophysical surveys.
- A proprietary database exclusive to Aben now consists of 21,000 geochemical samples in a very underexplored area of the NWT. The 2011 field work was successful in defining 4 high-priority targets warranting further exploration.

Tim J. Termuende, P.Geo., is a director and the Qualified Person for Aben Resources as defined by National Instrument 43-101 and has reviewed and approved the technical information in this presentation.
